

In 2006 we began development of an Intel SSE3/4 optimised version of our VSIBL library. In 2008 links with Intel developed and since then we have collaborated over development of tools to help convert users from PowerPC to Intel SSE and, more recently, AVX systems. These tools include VSIBL and other libraries, and two direct conversion tools aimed at converting PowerPC assembler calls to Intel assembler.

Crucially:

- Current generation Intel processors now outperform PowerPC while providing low power consumption
- Intel has a credible and incredibly fast-moving processor development programme, providing futureproofing for its customers
- We are well placed to help customer convert from PowerPC (and other DSP processors) to Intel Architecture
